## 一、权限设置

```
在 APP 的 AndroidManifest.xml 文件中添加如下权限:
```

```
<uses-permission android:name="android.permission.INTERNET" />
<uses-permission android:name="android.permission.ACCESS WIFI STATE" />
<uses-permission android:name="android.permission.ACCESS NETWORK STATE"</pre>
/>
<uses-permission android:name="android.permission.WRITE_EXTERNAL_STORAG</pre>
<uses-permission android:name="android.permission.READ EXTERNAL STORAGE</pre>
" />
二、添加 view 设置
<com.wangsu.libwswebrtc.WsWebRTCSurfaceView</pre>
       android:id="@+id/id surface view"
       android:layout width="match parent"
       android:layout height="match parent"
       android:layout centerHorizontal="true"
       android:textSize="24sp"
       />
三、创建 sdk
     WsWebRTCView webrtcView = findViewById(R.id.id_surface_view);
  2. WsWebRTCView 类定义如下:
      public interface WsWebRTCView extends VideoSink {
            //缩放模式参数,保留视频宽高比
         int SCALE_FIT = 0;
         //缩放模式参数,不保留宽高比
         int SCALE FILL = 1;
         //sdk 初始化
         void initilize(@NonNull WsWebRTCParameters rtcParams, @NonNul
      1 WsWebRTCObserver rtcObs);
         //获取 context
         Context getContext();
           //开始播放
         void start();
         //暂停播放
         void pause();
         //停止播放
         void stop();
         //释放资源
         void uninitilize();
         //静音, true/false
         void mute(boolean isMute);
```

```
//设置音量, 0.0~10.0, 默认 1.0
void setVolume(double volume);
//设置画面旋转角度:90/180/270
void setVideoRotation(int degree);
//设置缩放模式 SCALE_FIT/SCALE_FILL
void setScaleType(int scaleType);
//截图接口
void snapshot(@NonNull WsWebRTCView.SnapshotListener listener,
float scale);
//截图回调
public interface SnapshotListener {
    void onSnapshot(Bitmap bitmap);
}
...
}
```

## 四、sdk 初始化

1. 构造初始化参数 WsWebRTCParameters 类对象

```
WsWebRTCParameters webrtcParam = new WsWebRTCParameters();
//设置客户 id,由网宿分配给客户的 id 字符串
webrtcParam.setCustomerID(customerId);
//设置播放流
webrtcParam.setStreamUrl(streamUrl);
//设置是否使用 dtls 加密,默认加密,false:加密;true:不加密
webrtcParam.disableDTLS(false);
//设置视频是否使用硬解,默认硬解,false: 软解; true: 硬解
webrtcParam.enableHw(true);
//设置音频使用格式,默认 OPUS,音频格式类型见 WsWebRTCParameters 类定义
webrtcParam.setAudioFormat(WsWebRTCParameters.OPUS);
//设置连接超时时间,默认 5s,单位 ms
webrtcParam.setConnTimeOutInMs(5000);
//设置音频 JitterBuffer 队列最大报文数,影响时延,默认 50
webrtcParam.setAudioJitterBufferMaxPackets(50);
//设置是否开启追帧,默认开启,false:不开启:true:开启
webrtcParam.enableAudioJitterBufferFastAccelerate(true);
//设置统计值回调频率, 默认 1s, 单位 ms
webrtcParam.setPortalReportPeriodInMs(1000);
//设置 rtc 日志等级,默认 LOG NONE,日志等级类型见 WsWebRTCParameters
webrtcParam.setLoggingLevel(WsWebRTCParameters.LOG INFO);
//设置rtc 日志回调函数, loggable: WsWebRTCParameters.Loggable 对象,
见下文说明
webrtcParam.setLoggable(loggable);
```

2. 构造初始化参数 WsWebRTCObserver 回调类对象

```
WsWebRTCObserver observer = new WsWebRTCObserver();
```

3. 初始化

```
webrtcView.initilize(webrtcParam, observer);
WsWebRTCParameters 类说明
 public class WsWebRTCParameters {
       //音频格式参数
     public static final int OPUS = 1;
     public static final int AAC LATM = 2;
     public static final int AAC ADTS = 4;
     //rtc 日志等级
     public static final int LOG VERBOSE = 0;
     public static final int LOG INFO = 1;
     public static final int LOG_WARNING = 2;
     public static final int LOG ERROR = 3;
     public static final int LOG NONE = 4;
     public String getCustomerID();
     public String getStreamUrl();
     public int getLoggingLevel();
     public WsWebRTCParameters.Loggable getLoggable();
     public boolean isEnableHw();
     public boolean isDisableDTLS();
     public int getAudioFormat();
     public String getAudioFormatString();
     public int getConnTimeOutInMs();
     public int getPortalReportPeriodInMs();
     public double getDefaultVolume();
     public int getAudioJitterBufferMaxPackets();
     public boolean isEnableAudioJitterBufferFastAccelerate();
     public interface Loggable {
        void onLogMessage(String tag, int level, String message);
WsWebRTCObserver 类说明
 public interface WsWebRTCObserver {
       //异常回调
     void onWsWebrtcError(String err, WsWebRTCObserver.ErrCode cod
 e);
      //收到首包数据,0:audio, 1:video
    void onFirstPacketReceived(int mediType);
      //首帧渲染
     void onFirstFrameRendered();
     //卡顿状态通知, 0: 消除卡顿, 1: 发生卡顿
```

```
//分辨率切换
   void onResolutionRatioChanged(int width, int height);
     //统计数据回调,WsWebRTCPortalReport 类见下文说明
   void onPortalReport(WsWebRTCPortalReport webRTCPortalReport);
     //异常码
   public static enum ErrCode {
       ERR CODE SIGNAL TIMEOUT,
                                 //信令协商超时
       ERR CODE SIGNAL REFUSE,
                                       //信令被拒绝
       ERR CODE WEBRTC CONN FAILED,//rtc 连接失败
       ERR CODE WEBRTC DISCONN,
                                 //rtc 断开连接
       private ErrCode() {
   }
}
统计 WsWebRTCPortalReport 类说明
public class WsWebRTCPortalReport {
   private static final String TAG = "WsWebRTCPortalReport";
   //video stats
                mFirstVideoPacketDelayMs;
                                                  //从首包时间
   public long
   public long
                mFirstFrameRenderDelayMs;
                                            //从首屏时间
   public float mVideoDecodeFps;
                                                  //解码帧率
   public float mVideoDecoderAvgFps;
                                                  //平均帧率
   public float mVideoRenderFps;
                                            //渲染帧率
   public long
                                            //渲染收到的帧率
                mVideoRenderReceived;
   public long
                mVideoRenderDropped;
                                            //时丢弃的帧数
                                            //总卡顿时长
   public long
                mTotalFrozenTimeMs;
   public float
                                                  //总卡顿时长
                mFrozenRate;
/播放时长
                                                  //视频码率
   public long
                mVideoBitrate;
   public long
                                                  //解码帧数
                mFramesDecoded;
                                                  //丢帧数
   public long
                mFramesDropped;
   public long
                mFramesReceived;
                                                  //接收帧数
   public int
                                                  //丢包个数
                mVideoPacketsLost;
                                            //接收包数
   public long
                mVideoPacketsReceived;
   public long
                mFrameWidth;
                                                        //视频
宽度
   public long
                                                  //视频高度
                mFrameHeight;
   public long
                mVideoDelayMs;
                                                  //视频延迟
                mVideoJitterBufferDelayMs;
   public long
                                            //视频缓存延迟
   public long
                mVideoNacksSent;
```

void onNotifyCaton(int status);

```
rtt
         //audio stats
         public long
                      mFirstAudioPacketDelayMs;
                                                        //从启动到收
     到第一包音频数据的延时
         public int
                                                        //丢包个数
                      mAudioPacketsLost;
         public long
                                                  //接收包数
                      mAudioPacketsReceived;
                                                        //音频码率
         public long
                      mAudioBitrate;
         public long
                      mAudioDelayMs;
         public long
                      mAudioJitterBufferDelayMs;
         public long
                      mAudioNacksSent;
         //play stats
                                                        //平均码率
         public long
                      mAverageBitRate;
         public long
                                                              //播放
                      mPlayTimeMs;
     时长
     }
五、异常回调处理
void onWsWebrtcError(String err, WsWebRTCObserver.ErrCode code) {
     webrtcView.stop();
     webrtcView.uninitilize();
}
六、sdk 使用
 1. 启动 sdk
     webrtcView.start();
 2.
     暂停播放
     webrtcView.pause();
     重新播放
  3.
     webrtcView.start();
     退出播放
  4.
     webrtcView.stop();
 5.
    释放资源
     webrtcView.uninitilize();
```

public long

mRTT;

//rtp
